

(a) Carbon forecasting

Regional
carbon-intensity
data $I_s(t)$

Direct GBM models,
 $h = 1, \dots, 24$

Conformal
calibration with ACI

arc costs $\hat{c}_{os}(t+h)$

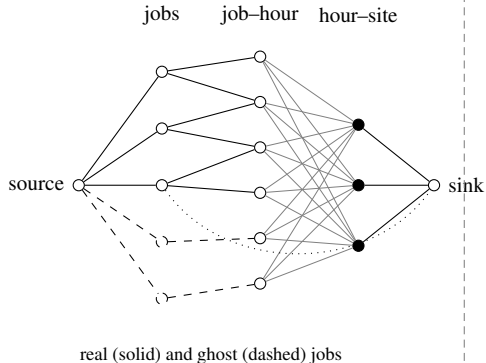

(b) Demand anticipation

Historical job traces

Demand profile
 $\bar{W}_{\tau ob}, \bar{M}_{\tau ob}$

ghost jobs, weight κ

(c) Hourly min-cost flow (Proposition 1)

Execute hour- t allocation
of real jobs; observe
 $I_s(t+1)$ and new arrivals

$t \leftarrow t+1$
